

Evaluating XIPU AI Agent for Student Academic Support

Awareness, task usability, trust, and continued-use intention at XJTU.

SYSTEM XIPU AI Agent Low-code educational agents with knowledge bases, plugins, and workflow support.	CONTEXT Student academic support Course questions, study planning, and knowledge-base consultation.	PARTICIPANTS XJTU students 100 survey responses, 12 to 15 usability participants.	METHOD Mixed methods Survey, task-based usability, observed performance, and interviews.
01 PROBLEM & MOTIVATION Availability does not guarantee discovery, appropriate use, trust, or task success. Students may not know which agent fits a task or where the limits of an answer lie. Gap: public evidence does not yet show how XJTU students encounter and use XIPU AI Agent for academic support.	04 EVALUATION DESIGN Sequential mixed-methods study: an online survey establishes awareness, trust, and adoption patterns; task-based sessions test whether students can complete representative goals. 1Consent Purpose + rights 2Survey Awareness + use 3Tasks Three scenarios 4Measures Success + SUS 5Interview Barriers + trust	06 PRINCIPAL FINDINGS RQ1 Awareness and use distribution RQ2 Task success, errors, and SUS RQ3 Association and uncertainty estimates RQ4 Barriers and thematic map Pending data: replace these placeholders with actual figures, statistics, confidence intervals, and anonymised evidence after data collection.	
02 RESEARCH QUESTIONS RQ1: What is students' awareness and current use? RQ2: How usable is the agent for representative tasks? RQ3: How are usefulness, ease, trust, and intention related? RQ4: What barriers and improvement opportunities emerge?	05 MEASURES & SAMPLE Task success Completion and assistance required Efficiency Time, prompt count, observed errors Usability 10-item SUS Trust Confidence and willingness to rely Acceptance Usefulness, ease of use, intention Barriers Interview themes and negative cases Sample rationale: N=100 survey; 12-15 usability participants. Approximate 80% power for r = .30 at α = .05.	07 INTERPRETATION & LIMITS The final interpretation will separate observed evidence from speculation and report contrary findings. Known limits include convenience sampling, self-report bias, a controlled usability setting, and no assumed system log access.	
		08 RECOMMENDATIONS Discovery Explain supported tasks at first use. Trust Show uncertainty and answer boundaries. Recovery Offer examples and correction paths. Policy Clarify integrity and data expectations.
